## 3.2 BACKLIGHT UNIT

Ta = 25 ± 2 °C

Parameter	Symbol	Value			Unit	Note
		Min.	Typ.	Max.		
Lamp Input Voltage	V <sub>L</sub>	612	680	748	V <sub>RMS</sub>	I <sub>L</sub> = 6.0 mA
Lamp Current	I <sub>L</sub>	2.0	6.0	6.5	mA <sub>RMS</sub>	(1)
Lamp Turn On Voltage	V <sub>S</sub>	-	-	1370 (25 °C)	V <sub>RMS</sub>	(2)
		-	-	1520 (0 °C)	V <sub>RMS</sub>	(2)
Operating Frequency	F <sub>L</sub>	45	-	80	KHz	(3)
Lamp Life Time	L <sub>BL</sub>	15,000	-	-	Hrs	(5)
Power Consumption	P <sub>L</sub>	-	4.5	5.0	W	(4)

Note (1) Lamp current is measured by utilizing a high frequency current meter as shown below:

Note (2) The voltage that must be larger than V<sub>S</sub> should be applied to the lamp for more than 1 second after startup. Otherwise the lamp may not be turned on.

Note (3) The lamp frequency may produce interference with horizontal synchronous frequency from the display, and this may cause line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible.

Note (4) P<sub>BL</sub> = Inverter input power

Inverter input power is measured at 8<sup>th</sup> step (the max brightness step) @V<sub>in</sub>=12V

Note (5) The lifetime of lamp can be defined as the time in which it continues to operate under the condition Ta = 25 ± 2 °C and I<sub>L</sub> = 6 mA<sub>RMS</sub> until one of the following events occurs:

- When the brightness becomes or lowers than 50% of its original value.
- When the effective ignition length becomes or lowers than 80% of its original value. (Effective ignition length is defined as an area that has less than 70% brightness compared to the brightness in the center point.)

Note (6) The waveform of the voltage output of inverter must be area-symmetric and the design of the inverter must have specifications for the modularized lamp. The performance of the Backlight, such as lifetime or brightness, is greatly influenced by the characteristics of the DC-AC inverter for the lamp. All the parameters of an inverter should be carefully designed to avoid producing too much current leakage from high voltage output of the inverter. When designing or ordering the inverter please make sure that a poor lighting caused by the mismatch of the Backlight and the inverter (miss-lighting, flicker, etc.) never occurs. If the above situation is confirmed, the module should be operated in the same manners when it is installed in your instrument.

The output of the inverter must have symmetrical (negative and positive) voltage waveform and

symmetrical current waveform.(Unsymmetrical ratio is less than 10%) Please do not use the inverter which has unsymmetrical voltage and unsymmetrical current and spike wave. Lamp frequency may produce interface with horizontal synchronous frequency and as a result this may cause beat on the display. Therefore lamp frequency shall be as away possible from the horizontal synchronous frequency and from its harmonics in order to prevent interference.

Requirements for a system inverter design, which is intended to have a better display performance, a better power efficiency and a more reliable lamp. It shall help increase the lamp lifetime and reduce its leakage current.

- The asymmetry rate of the inverter waveform should be 10% below.
- The distortion rate of the waveform should be within  $\sqrt{2} \pm 10\%$ .
- The ideal sine wave form shall be symmetric in positive and negative polarities.

\* Asymmetry rate:

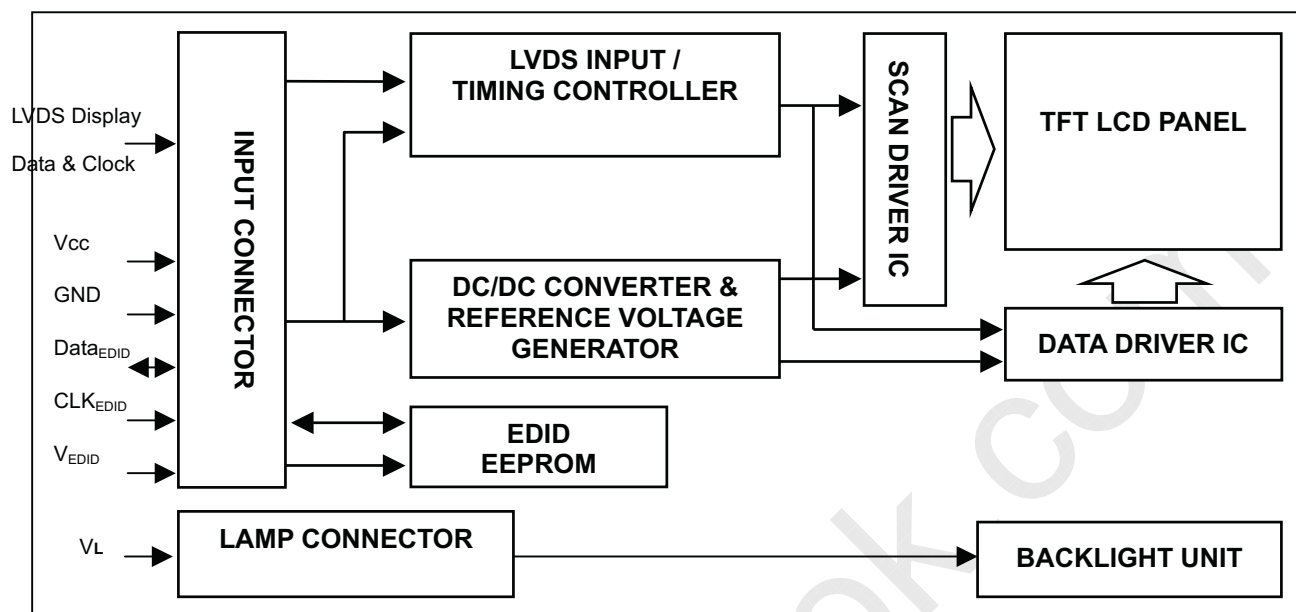

$$|I_p - I_{-p}| / I_{rms} * 100\%$$

\* Distortion rate

$$I_p \text{ (or } I_{-p}) / I_{rms}$$

Signal	Item	Symbol	Min.	Typ.	Max.	Unit	Note
DCLK	Frequency	1/Tc	25	44.5	60	MHz	(2)
DE	Vertical Total Time	TV	910	926	1500	TH	-

(2) 2 channels LVDS input.

#### INPUT SIGNAL TIMING DIAGRAM

### 7.2 POWER ON/OFF SEQUENCE

## Timing Specifications:

$$0.5 < t_1 \leq 10 \text{ msec}$$

$$0 < t_2 \leq 50 \text{ msec}$$

$$0 < t_3 \leq 50 \text{ msec}$$

$$t_4 \geq 500 \text{ msec}$$

$$t_5 \geq 200 \text{ msec}$$

$$t_6 \geq 200 \text{ msec}$$

Note (1) Please follow the power on/off sequence described above. Otherwise, the LCD module might be damaged.

Note (2) Please avoid floating state of interface signal at invalid period. When the interface signal is invalid, be sure to pull down the power supply of LCD Vcc to 0 V.

Note (3) The Backlight inverter power must be turned on after the power supply for the logic and the interface signal is valid. The Backlight inverter power must be turned off before the power supply for the logic and the interface signal is invalid.

Note (4) Sometimes some slight noise shows when LCD is turned off (even backlight is already off). To avoid this phenomenon, we suggest that the Vcc falling time is better to follow  $5 \leq t_7 \leq 300 \text{ ms}$ .

		$\theta_{y-}$		40	45	-		

Note (1) Definition of Viewing Angle ( $\theta_x$ ,  $\theta_y$ ):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{63} / L_0$$

$L_{63}$ : Luminance of gray level 63

$L_0$ : Luminance of gray level 0

$$\text{CR} = \text{CR} (5)$$

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time ( $T_R$ ,  $T_F$ ):

Note (4) Definition of Average Luminance of White ( $L_{5p}$ ):

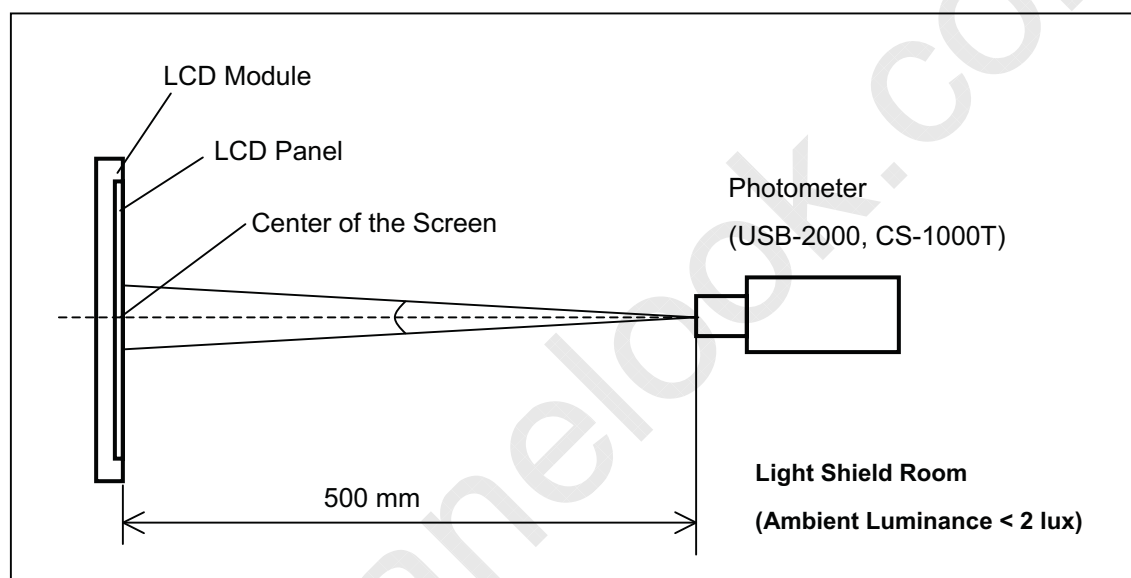

Measure the luminance of gray level 63 at 5 points

$$L_{5p} = [L(5) + L(10) + L(11) + L(12) + L(13)] / 5$$

$L(x)$  is corresponding to the luminance of the point X at Figure in Note (6)

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

Note (6) Definition of White Variation ( $\delta W_{5p}$ ,  $\delta W_{13p}$ ):

Measure the luminance of gray level 63 at 5, 13 points

$$\delta W_{5p} = \{1 - \{ \text{Minimum} [L(5) + L(10) + L(11) + L(12) + L(13)] / \text{Maximum} [L(5) + L(10) + L(11) + L(12) + L(13)] \} \} * 100\%$$

$$\delta W_{13p} = \{1 - \{ \text{Minimum} [L(1) \sim L(13)] / \text{Maximum} [L(1) \sim L(13)] \} \} * 100\%$$

Note (7) Definition of color gamut (C.G):

$$C.G = \Delta R G B / \Delta R_0 G_0 B_0 * 100\%$$

$R_0, G_0, B_0$ : color coordinates of red, green, and blue defined by NTSC, respectively.

$R, G, B$ : color coordinates of module on 63 gray levels of red, green, and blue, respectively.

$\Delta R_0 G_0 B_0$ : area of triangle defined by  $R_0, G_0, B_0$

$\Delta R G B$ : area of triangle defined by  $R, G, B$

## 9 PRECAUTIONS

### 9.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the lamp wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.

### 9.2 SAFETY PRECAUTIONS

- (1) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (2) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (3) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly, and the starting voltage of lamp will be higher than the room temperature.

### 9.3 OPERATION PRECAUTIONS

- (1) Do not pull the I/F connector in or out while the module is operating.
- (2) Always follow the correct power on/off sequence when LCD module is connecting and operating. This can prevent the CMOS LSI chips from damage during latch-up.
- (3) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with inverter. Do not disassemble the module or insert anything into the Backlight unit.
